Annotation of Chat GPT Article

As I read the article on CHatGPT by the Society for the Teaching of Psychology, I was able to evaluate the article and understand how they conducted their survey. The survey was very organized and detailed in numbers. Most of the information and results of the survey are recent, within the last 10 years. Some of the limitations may be that they only conducted the survey in one class at a university.

I was shocked by the information in this article, but I didn't realize the ChatGPT was very recent. I can see that it recently put a lot of challenges on professors and students to properly use it to help you but not do the work for you, and professors are trying to learn to analyze if students are being true.

The article on ChatGPT was written to inform the public and conduct surveys of college students about the reality of how artificial intelligence has entered their lives. Many of them use it for different reasons in college. Still, it has become a struggle for higher education professors to check students' assignments to be sure they are not engaging in academic misconduct. The survey and research done on the students at the college institution help them understand how

students use AI in their college life using their academics. Ultimately, this should help colleges build policies on how or when to use artificial intelligence to lower academic dishonesty.
