Reflection 3 Challenger

Many mistakes led to the Challenger explosion. One was group thinking, as everyone wasn't on the same page about communicating the serious problem related to the safety of the launch. Morton Thiokol was the O-ring manufacturer and wasn't responsible for themselves to take action on the safety of the problem that could cause casualties, which it did. The importance of the project challenger was significant, and so much was expected, but the pressure affected the actions, and they did not slow down much on retaining or working on the O-ring. Had they taken the time and communicated with people on the understanding that they needed time to build the Challenger. People as the public and the program organizer would have understood.
