Article Annotation

The research was very detailed, writing about the different sides of what caused water inequality. They wrote about the political and historical aspects of how things caused water inequality.

Yes, the results are significant, opening the eyes of the public to see that people are struggling to access clean water and facing environmental challenges. It also shows how money in power takes over areas that offend others, to move because of a lack of resources and support from economic struggle.

I feel that there are some biases or limitations because they research and write in one area or topic more than others. The elites are more open to or write more about other issues that might have also contributed to the struggle of the area's lack of water inequality.

The topic relates to another article I read about a town that struggles with water inequality because of a lack of funding from the city and acknowledgment from the state. This current research supports my previous knowledge. It shows how even today, people still struggle with the ability to have clean and safe water in their homes for everyday use. This research article will show that future research that looks into the past of the topic they research may find that much has changed; some of the reasons for the struggle of the past may also be the struggle of a problem now.
