

## Reflection #1: Observation and inference

Before visiting the garden, we wanted to observe the overall vibe, check out the audience demographics, and see how the garden scenery attracts its consumer base. We will then use whatever we observed to update/create an implementation plan incorporating the garden's aspects while addressing the MOBOT problem. I think Jennifer was well-spoken and grabbed my attention; there are multiple implementation plans, but with our team's focus, we think that "My Guide to the Garden" is a crucial aspect of our implementation plan.

The interpretation plans from the workshop exercise had cool concepts. Each idea had its pros and cons. For instance, a flyer that includes information about prominent historical Black figures, along with questions and writing assignments, is great for engagement and helps with understanding and retaining the information. However, a downside to this approach is that people might have shorter attention spans, and younger children might not be able or struggle to engage. The video and QR code approaches were both good and user-friendly. A con for the QR code is that it's not accessible to people who don't have a phone or an electronic device to scan it. As for the YouTube video, it had good information but wasn't very engaging.

Our partners seem enthusiastic about working with us. Some obstacles I foresee are time constraints, uncertainty about the resources we can use, and figuring out who we need to contact to start and complete our plan.
